STOCK MUST BE CLEARED

NO REASONABLE OFFER REFUSED

OPEN 9.30 AM - 5PM Monday to Friday 9 AM - 12noon Saturday

Brand new Valves and Semiconductors.

2N 3055	\$2.00
OA91	15c
807 Valve	\$2.00
IT4-6C8	75c
IR5	75c
6BA6-6AK5-6V6G	\$1.00
2E26	\$3.00
6SJ7GT	\$1.50
Coil Formers 1 1/4 Inch diameter. Octal base	45c

I.V.O Model 7 & 8 Multimeters. As new condition from **\$35.00**

V.H.H Transceiver TR 1935 (Suitable for 2 metres AM) 24 Volt **\$28.00**

No. 19 & No. 62 Transceivers. Plenty of part wrecked units any reasonable offer will buy.

Headphones, ex Army. Brand new. Low impedance in sealed boxes **\$2.00 pair**

Transformers, A & R 240 V - 12Volt new **\$2.50**

LARGE QUANTITIES of hard to get valves, transformers, semi-conductors & components, dural tubing, cables multicore & coaxial, connecting leads Cannon type plugs multipln, relays PMG types & minature, telephone parts, teleprinter units, all types of panel meters new & used, test equipment, multimeters, signal generators, oscilloscopes, power supplies, standard racks and thousands of component parts, potentiometers, capacitors oil filled & electrolytic, high & low wattage resistors, transistor circuit boards, crystals.

AMERICA TUNING UNITS

1.6 to 3 M/C variable. 115PH HV condenser, ceramic formers. Good for wrecking. **\$12.00**

A.W.A. RC Audio Oscillator, 20Hz to 200kHz in 4 bands. HI Z & 600 ohm 240 Volt AC **\$65.00**

Army Transceivers—We have just received a shipment of the most modern we have ever been able to offer. Complete with 24 Volt DC power supply, Leads and Ear Phones. All are continuous coverage. Manufactured by Plessey.

C13 1.00MHz - 12MHz FM/AM \$65
In 12 bands each of 1MHz.

C42 36MHz - 60MHz FM \$65
B47 38MHz - 56MHz FM \$45

C11 TRANSMITTER 2MHz - 4MHz 4MHz - 8MHz, 8MHz - 16MHz. Continuous coverage with built-in Calibrator. Complete with 24 Volt Power Supply **\$65.00**

FREQUENCY METER Manufactured by American Disco-Wyne Model AM/URM 32A. 125kHz 1000MHz. AC Power Supply Head Phones and Calibration Charts **\$130**

Bendix BC227 Frequency Meters from **\$35.00**

COAX CABLE 58 ohm Ascand 15 Pl/24. Brand new 1/8" outside diameter. 12c per yard, \$10 per 100 yard reel.

BAND-PLANNING—THE FINAL WORD

For some years now the vexed question of 2 metre band-planning—centred around the frequencies to be used by satellites and repeaters—has been thoroughly thrashed.

Clearly, there is an international problem, directly related to the increasing use of both satellites and repeaters.

Australian Amateurs cannot bury their heads in the sand and "go-it-alone" on what we might prefer to see as maintaining the status quo or saving a few dollars on crystals.

Surely, we as Amateurs must recognize the fact that in the IARU community, although we are entitled to an opinion as Australians, we cannot be so cavalier in our expression of opinion as to ignore an international problem of interference which WOULD be to the detriment of amateurs here and elsewhere in the world in their enjoyment of the facilities which Amateur Satellites make available.

While recognising this aspect, there is, of course, a need to be fair to those users of the 2 metre band whose interests may be other than satellites.

What then are we doing or have we done about solving the problem?

Basically, there have been three major conferences. These were: Wodonga (1968), Albury (1972) and the Easter 1973 Convention.

All were aimed at 2 metre Band-Planning, and they all failed to produce a continuously acceptable plan.

What is a band-plan?

More important; what is an acceptable band-plan?

Presumably, a band-plan is a scheme for maximum utilization of a slice of the frequency spectrum giving the maximum benefit to all users, no matter what mode is employed, with absolute minimum interference between modes or users.

A plan, by definition, is some orderly arrangement of facts, or figures, or other detail—each item positioned relative to the others—and since a plan is something which is projected into the future, it should be as far-sighted as possible; allowing for future expansion or alteration.

This then would appear to be an acceptable band-plan.

The Wodonga Plan seems to meet some of the requirements but does not have an orderly progression about it.

The Albury Plan, although undoubtedly not the only solution to the problem, is favoured by most Divisions and, as a long-term band-plan has more attractions.

Looking at the sorry mess of dissent which followed the Easter 1973 Convention, it is not surprising that the South Australian Division's Federal Councillor, in a requisition dated 7th August, 1973, sought an Extraordinary Convention to consider and vote on the 2 metre band-plan.

All necessary provisions of the Companies Act of Victoria having been satisfied, this Extraordinary Convention was held at the lecture room of the WIA, Victorian Division, Melbourne, on the afternoon of Saturday, September 15, and continuing the following morning.

All six Federal Councillors and the Executive were present as well as several observers and visitors.

A communique was issued in time for the Sunday morning VK3 broadcast and the contents were conveyed to Sydney for inclusion in the VK2 broadcast. The following policy was established in respect to the 2 metre band-plan, to be known as "The WIA 2 metre band-plan", which, subject to PMG Dept. approval being obtained, set out the repeater input channel frequencies at 50kHz spacing starting at 146.100MHz, ending at 146.400MHz with output frequencies 600kHz above the respective input frequencies.

Simplex channels were set out at 50kHz spacing beginning at 146.450MHz and ending at 146.650MHz, with 146.500MHz to be developed as the national simplex channel and 146.600MHz as the RTTY channel.

Also implemented was a channel numbering system starting with 144.000MHz as Channel 0 rising by 1 at each 50kHz step.

It was agreed that Channel 4 be changed as soon as possible and that the other existing channels be changed at an appropriate time.

All this, then, is the WIA 2 metre band-plan ready for implementation.

John McL. Bennett, VK3ZA.

OUR ONLY INTERNATIONAL CONTEST—JOIN IN THE FUN

USING THE AX PREFIX

Sunshine State Convention

6th and 7th October in the Amateur Wrestling Club Hall, 54 Philip St., Leichhardt, Ipswich. Queensland open from 08.30 hours on the Saturday with the official opening at 14.00 hours. Further details obtainable from the Honorary Secretary, W.I.A. Queensland Division, GPO Box 638, Brisbane, Qld. 4001.

Contest Awards

The IARU Calendar for June-July 1973 finds it necessary to issue a reminder that international regulations define a radio amateur as a "... person interested in radio technique solely with a personal aim and without pecuniary interest". Contests whose main prizes are rewards in the form of expensive pre-paid trips violate this principle, and may cause difficulties for the amateur service at future international conferences.

BOX 88 MOSCOW

At the Club headquarters a full-time staff of 8 is employed in a building of 1800 m (about 19000 sq ft) on two or three levels. Apart from administrative offices, the building houses a library of 48,000 reference books (this figure not including magazines), and about 12,000 technical articles, a reading room, a lecture theatre about the size of a small cinema, a small lecture room, a laboratory and workshop and, of course, a QSL bureau — with a full time staff of four women who handle annually about 2.5 million cards. There are 46,000 licensed amateur operators in the Soviet Union and 4,600 clubs with over 17,000 members. ZL1HJ, writing in Break-in of July 1973 on a visit to "Box 88, Moscow".

Amateur Radio under fire

Where are we heading? Radio Communications of July 1973 carries a leader about "good housekeeping" and comments "At one time it was accepted that the courtesy of the amateur operator was unquestioned, nowadays the manners heard often leave much to be desired. It seems that the standards have declined with the improvement in equipment". The leader not only mentions bad language, the defiance of both the law and reasonable standards of conduct and the activities of pirates but also comments "unless an improvement is effected (if all leads) to the loss of frequencies at the next ITU conference". Reading between the lines this seems to be more or less an international disease which can only lead to a hardening of officialdom towards amateur radio — please pass this on to the ratbag.

tuning and feeding a 40 metre yagi

BRUCE R. MANN VK3BM
P.O. Box 724, Swan Hill, 3585.

Most visitors to Swan Hill will be impressed by VK3BM's 40 metre beam which is a prominent feature of the skyline. DX stations are equally impressed by his 40 metre signal. Here's how it was done!

When contemplating the construction of a full sized 3 element 40 metre Yagi I did much searching of books and magazines and much questioning of the "experts" on the DX 40 metre band.

Apart from structural worries there appeared to be 3 major design problems:-

1. The lengths of the elements
2. Coupling the feedline to the antenna
3. The feedline itself

PROBLEM 1.

I came across various references to change of resonant frequency of a Yagi if tuned near the ground then elevated to the top of a tower. Seemingly it should be tuned at least a half-wave above ground if the resonant frequency is to stay put when elevated.

Thus one can readily adjust 2, 6 or 10 metre yagis from a step-ladder — and even 15 metre and 20 metre yagi's well enough — but what-ho a 40 metre beam! That would be a mammoth task even with the aid of the Fire Brigade's motorised ladder!

Then why not cut elements to length by formula? From various sources I found that the usual stepped or tapered elements do not conform to the formula. For instance W3MWC designed his beam with elements stepped from 1 1/4 inch down to 1/2 inch and element lengths cut to formula for 7020 kHz, but when elevated to 100 feet the performance was atrocious! He found that the antenna resonated at 7400 to 7500 kHz, and that an addition of approximately 4 feet was needed to each element to attain proper operation.

So I decided to use un-tapered elements of 2 inch diameter throughout and cut them by formula. Actually aluminium scaffolding tubing was used at the centre of each element and light gauge aluminium tubing of the same outside diameter at the element ends. Joints were made by forcing the tubes until they butted together over a machined section of aluminium alloy rod, then electric welding around the joint. This eliminated the resistance losses common in clamped aluminium joints. The elements were cut to formula for 7100 kHz namely:-

Spacing	20 ft.
Driver Element	70 ft. 3 in.
Reflector Element	66 ft. 7 1/2 in.
Director	61 ft. 5 in.

To cater for the heavier than normal material and greater wind loading of these elements the 40 foot boom was of triangular lattice steel construction.

PROBLEM 2.

The Co-ax feeder is usually matched to the driven element by the gamma match method but this necessitates a gamma rod with an adjustable clamp at least 6 feet from the boom, plus a variable capacitor in weather proof housing. I couldn't imagine myself adjusting this setup 86 feet up in the air! In any case, users of this method had reported very lopsided field strength patterns. A Tee match was reported to be more symmetrical when used with a balun, but is quite complicated and hard to adjust.

Then over the air came a suggestion which I finally adopted. The driven element was cut in the centre, insulated, and each half attached to the centre conductor of one of a pair of 50 ohm co-ax feeders, the outer braided conductors being joined.

The support and insulation of the two halves of the driven element was achieved by slipping short lengths of polythene tubing over the inner ends and clamping to three feet of impregnated hardwood beam.

PROBLEM 3

The feedline then is a side-by-side pair of 50 ohm co-ax cables with shields connected together, and at the shack end connected to the transmitter through a Johnson Matchbox. Obviously the feed is symmetrical and shielded, giving maximum directivity to the antenna, minimum feedline radiation and lowest noise pickup when receiving and of course a perfect match at the transmitter.

But what of the match at the antenna? The two cables add up to 100 ohms feeding into about 35 ohms — but who's afraid of a 3:1 mismatch at 7 MHz? Not me! The particular co-ax used had a rated loss at 7 MHz of 0.4 dB per 100 feet; and this loss doubles at an SWR of 4:1.

The text book says that most of the loss in co-ax is in the braid, because RF currents tend to go in straight lines rather than follow the convolutions of the individual wires of the shield.

In the double co-ax feeder set-up under consideration the braids are merely shields, not conductors of power so that losses are greatly reduced.

Anyway, what's one dB off an S9 signal! So this homebrew antenna was cut by tape measure, assembled to the homebrew self-supporting tower with feedlines and homebrew rotator connected, and the whole winched up without any antenna tune-up procedure whatever.

IT WORKS!

At 1125 GMT April 4th, 1971 I called a group of five W's who gave me S meter readings from 9 + 20 dB to 9 + 50 dB. The symmetry, sharpness and front-to-back ratios are in keeping with the performance, and the Collins O-200 watt power meter permanently in the TX output seldom hits the top pin.

I am sure you will agree, that with this design the problems are all structural — the usual problems of adjustments and tune-up have disappeared. I wish to acknowledge helpful information, ideas and encouragement in this project from VK2AVA and VK3HW.

PLEASE NOTE:

W.I.A. WESTERN ZONE CONVENTION

Owing to circumstances beyond our control Our Convention will now be held on **November 3rd and 4th at Stawell and Halls Gap.**

C.G.S

TYPE C MINIATURE VITREOUS ENAMELLED POWER WIREWOUND RESISTORS

Approved to BS 9114 - N002 style 2E-56

SPECIFICATIONS

The 'C' Series of miniature wirewound, vitreous enamelled resistors has been designed to meet the requirements of Specification BS 9114 - N002, and full Qualification Approval has been granted. A Test Report Summary is available on request: this report shows that many of the performance levels are in fact much higher than the specification acceptance levels.

The use of specially selected materials, combined with the application of exacting quality control throughout all stages of production ensures the consistent achievement of a very high standard of reliability.

ELECTRICAL SPECIFICATION

Tolerance: $\pm 5\%$ is standard on values of 1Ω and above and $\pm 10\%$ between 0.1Ω and 1.0Ω . For non standard values and tolerances please consult the factory.

Resistance values: C Series resistors are available with the preferred ohmic values of the E24 Series within the ranges shown in Table 1.

Temperature coefficient: Typically less than 100 ppm/ $^{\circ}\text{C}$ and never exceeding 200 ppm/ $^{\circ}\text{C}$ over the category temperature range -55°C to $+200^{\circ}\text{C}$

MATERIALS

Core: High purity steatite ceramic. Chemically inert, capable of withstanding severe thermal shock and impervious to moisture. Ground to close tolerance finish to give maximum contact with wire element for rapid heat transfer.

Resistance Element: High quality nickel-chrome or nickel-copper alloy depending on resistance value; wound at minimum tension.

End Caps: Formed to close tolerances from a special nickel-iron alloy chosen for its consistent welding properties and glass sealing characteristics.

Leads: Solder coated nickel A.

Uncoated leads can be supplied for welding.

Specify - 'weldable leads'.

Preformed and cropped leads can also be supplied on request.

Coating: Humidity proof vitreous enamel with carefully controlled expansion matched to the materials of the resistor.

amateurs assist in air race

Andy Andrews

Secretary, Dubbo Amateur Radio Club, VK2BMA

The recent Sydney to Dubbo Air Race has been hailed as a great success and I would like to tell you of a few Amateurs who contributed their time and energy to this object.

About two months before the race the State Emergency Service Signals Section, Macquarie Division, of which I am a member, was asked to provide radio communication facilities for the air race.

Basically what was required in our area was a radio link between Mudgee Airport and the Headquarters at Dubbo and also a radio link between the marker area which non-stopping planes flew over and identified to Mudgee Airport a distance of about four miles.

The main link between Mudgee and Dubbo was to be with the State Emergency Service SSB sets on their frequency of 3743 kHz, whilst the local link was to be with "Pony" transceivers on 27.230MHz.

Some doubt was expressed on the reliability of the HF communications link due to the normal daytime conditions on the 80 metre band and it was decided to invite the Amateurs in the area to participate in setting up a secondary channel on 2 metres through the Orange Amateur Radio Club's repeater on Mt Canobolis, VK2AOA-RI (FRED). The Amateurs showed great interest and many points were discussed on the 7.30pm rag chew on the following evenings.

On the Sunday preceding the race the SES contingent for Mudgee went to the Airport for a dummy run on their equipment and to erect a 60ft mast to take the 80 metre inverted V. Robert Alfrod, VK2ZRJ and Alan Wright, VK2BVL made the trip from Orange.

Meanwhile, at Dubbo, Ces Kearnes, VK2AKC had constructed a 2 metre beam from 8 gauge fence wire with an SWR of 1-1.5, (we will have to check his SWR meter) and this had been fixed to the roof of the SES Headquarters at Dubbo, and no difficulty was experienced in triggering "FRED" at Orange.

Robert and Alan at Mudgee experienced difficulty in getting through to the repeater using a ground plane and it was obvious that further thought had to be given to the matter. The SES HF system to Dubbo worked perfectly but the important link between the marker area and Mudgee was poor.

During the next week an offer by Tom Stroud, VK2AMR for the loan of his beam and a mast was quickly accepted. It was dismantled and taken to Mudgee and a quick test with the little KEN 2 Watt transceiver showed that the 2 metre link to Dubbo via FRED was established.

Dawned the race day and Robert arrived at Mudgee from Orange at the early hour of 7.00 am complete with beam and ground planes attached to the roof of his car. After erecting a ground plane at the Airport he joined the frozen band of stalwarts in a frost covered paddock four miles away. A fire that had

been started to provide some warmth had to be extinguished as the smoke was concealing the marker from being seen from the air. Robert erected a beam on a pole in the middle of the paddock and established a Channel B 2 metre link back to the base, and for the rest of the day he was kept very busy transmitting the marker changes and the identification numbers of the planes that passed overhead. Bill Baylis, VK2BVW and Ken North, VK2ZAN travelled up from Bathurst to assist.

Due to the exceptional conditions on 80 metres the Secondary 2 metre link to Dubbo was not used. However, after the race was over the Controller of the Macquarie Region SES was able to talk to his Mitchell Region counterpart in Bathurst (Bill Baylis) over the 2 metre Fred link and was impressed what can be done with VHF and a Repeater. ●

technical articles for ar

- always in demand — needed now.
- any subject of general interest.
- constructional — theoretical—humorous
- long articles—short articles—medium articles
- hints and kinks.

You and DX

COUNTRY CRITERIA. What constitutes a 'country' for the purposes of the IARU awards (IWAC, WAZI)? IARU Region 1 News of Aug. '73 lists 4 criteria summarised below.

Firstly a Government-Administration 'country' is an area by reason of Government or a distinctively separate administration constituting a separate entity. (Comment by an ignorant DX'er — how come, then, that GM and GW are separate 'countries' but not VK and VK3, etc, or are the latter States considered to be in the same category as the States of the USA?)

Secondly in two bites are islands and groups of islands. An off-shore island is a separate 'country' if it is not less than 225 miles of open water distant from the mainland provided the island is not part of or located adjacent to an island group. An island group must be at least 500 miles of open water away from anything administered by the same government or administration.

Thirdly two pieces of a country listed 'firstly' above which are completely separated by a foreign country must be at least 75 miles of land apart.

Fourthly any unadministered area is ineligible for consideration as a separate entity.

It is always interesting to consider the variations and implications of separate 'countries' status for different awards and purposes. It is also interesting to observe how the rules of various awards in relation to country status can be applied to uninhabited pieces of rock or sand scattered over the face of the globe. Remote places such as Rockall and a few reefs await activation one day but others once thought nearly impregnable such as Bouvet have succumbed. What price the DX activation of space vehicles? Would each be a separate country perhaps?

Verona. The Netherlands Antilles amateur radio society celebrates its 25th anniversary with a special activities month during December 1973 when the PJ2 stations will be using the PJ1 prefix. The Secretary of VERONA also advises that the beautiful Curacao Certificate will be issued free for working three PJ1 stations during December 1973. Applications by air mail, with details, before 1st February 1974 to P.O. Box 383, Curacao.

City of Joao Belo Award. The Mozambique Society advises that a special award will be issued to anyone working CR7CJB plus at least one other of CR7ER, CR7LZ or CR7RA in the period 1st to 31st October 1973 on the DX bands 40 to 10 metres. Send OSI cards to Câmara Municipal de Gaze, P.O. Box 14, Joao Belo, Mozambique. ●

Schlumberger

the CW net

a first for Australia

F. J. Miller, VK4II

95 Stanley Terrace, Taringa, Qld., 4068

An activity has recently started up on 40 metres which might well be the first of its kind ever. A group of CW ragchewers discovered that if they organised their round-tables along rudimentary traffic net lines, a degree of freedom was achieved which the good-natured chaos of random break-in could not offer.

This group of east coast VK stations, which had been meeting informally over a period of time before the idea of a net was hit upon, recognised the possibilities of an improved ragchew session which maintained order by the simple expedient of setting up a control station whose function it would be to assemble all the parties together and then pair them off for short QSO's. The concept of course was basically different from the round-table format it began from, but it had the advantage of enabling people to come and go as they pleased and it offered each person the chance to do more operating himself.

It was felt by many that the round-table seemed somehow to get monopolised by the most talkative ones and it was difficult to remember all the calls in order, and all the names, not to mention the problem of copying the weak fellow who seemed to invariably get clobbered by a break-in station . . . what a mess it became at times, and how hard it was to politely escape from.

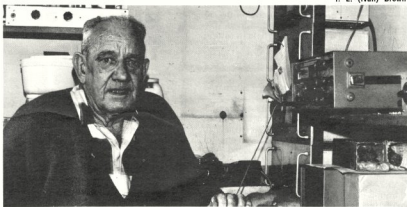

Thus began an exciting activity which has been running successfully and in earnest for over 20 weeks, with a typical weekly attendance of 14 stations. On the low end of 40 metres each Sunday morning, a lone station calls CQ CWN* and with that invites all interested CW stations to call in and relax while he proceeds to pair one station off with another and suggests a frequency to shift to. When each station has acknowledged that he has his information, he is on his own. After a pleasant QSO and a chance to get in some real operating (not always possible in a round-table) one returns to the net frequency, reports in, and awaits another assignment. Code speed is not a problem because if you are slow, the net control station (NCS) will oblige by finding someone who prefers to go slow too. If it is speed you are after, there is always someone who will take you on. Best of all, if you want to bow out for whatever reason, just tell the NCS . . . no messy apologies needed. The CW Net concept is simple: drop in for the fun and leave when you choose. No need to wait interminably for a chance to break in or to leave.

The current net procedures have evolved from early attempts at efficiency through rigorous use of the QN code (the ARRL traffic net Q-code) to the present neat but casual

C. M. (Mac) Hicks

procedures involving mainly the signal QN1 ("I report in") and one or two others such as QNX ("I request to be excused for a while") and QNO ("I'm off, cheers"). The NCS uses such QN codes as QND ("Net is underway") and QNF ("Net is finished for today").

Several ARRL publications list the QN code, but even if one did not at first know a single Q signal the NCS would understand and pair you off anyway.

If you wanted to get in touch with someone in particular whom you were not

sure was on the air, a check call to the NCS would sort the problem out without formality other than a quick report in and out. Formality is purposely kept to a minimum because experience to date has shown that rigidity creates its own problems not the least of which is early waning interest. To keep order, however, demands competence on the part of the net control station which might appear to require a superman, but this has not proved to be at all necessary. Those stations who have volunteered to be NCS have among themselves evolved a simple logging system which works well and is easy to learn. (The logging and control technique is available from the author.)

Thus far the NCS role has proved very popular and there has been no reluctance by operators to give it a go. There are always a sufficiently large percentage of NCS oriented people to fill this role and so far no-one has felt pressured to have to offer his services.

To date the net has been limited in its operation to a two hour period on Sunday mornings** and for an average attendance each station enjoys up to 5 OSOs. Due to skip conditions on 40 metres the activity has been centred on NSW and Victoria, but stations from VK5, VK4, and ZL are heard regularly.

What is needed now is decentralisation, both as to operating bands and geographical regions. Currently an 80 metre CW Net is in the embryo stage. Judging by the genuine and continuing interest shown in the net so far, it seems likely that the ragchew net concept could attract interest overseas as well. Perhaps the real strength of the net lies in the fact that it does not discriminate. All CW operators are encouraged to join in, although speeds of under 15 wpm do make

a VFO for 5-5.5 MHz

Drew Diamond, VK3ANU

55 Wimberly Parade, Ashwood, 3147

Here is a modern solid-state VFO designed for easy construction using locally-available parts. This, allied with its excellent performance, may well make it the VK amateur's standard VFO.

Many transceivers today use some form of frequency synthesis or mixing process to derive a desired output frequency.

The mixing method is a very good one for several reasons, one of which is excellent frequency stability. For example, if an output frequency range of 28.0 to 28.5 MHz is required, it could be obtained by mixing 5 to 5.5 MHz and 23 MHz, the latter being furnished by a crystal oscillator. Using this method, the stability of the output frequency will be similar to that of the 5 MHz component, any drift which may occur in the crystal frequency being relatively small.

To derive a stable output frequency it only remains therefore, to provide a source of 5 to 5.5 MHz signal which, when set to the required frequency, will continue to maintain that frequency, and not be affected by the changing environmental conditions the oscillators may undergo during a communication period.

Using this method of frequency production, the VFO can be allowed to run continuously, preferably 24 hrs per day.

The VFO to be described here will provide such a variable source. Frequency range is 5.0 to 5.530 MHz. Stability is in the order of 2 parts per million per hour after warm up. The frequency curve can be linearized using the split segments of the capacitor shown. Output voltage is 3 volts peak to peak sine wave into 1000 ohms. Supply requirement is 12.6 volts at 25 mA. A supply voltage change of plus or minus 1 volt will result in a frequency change of about 1 Hz.

A FET is used as the maintaining device rather than a bi-polar transistor in the interest of improved stability with changes in temperature.

The components of the oscillator and buffer amplifiers are laid out on an etched fibre-glass board measuring 7 x 9 cm. Good mechanical stability can be secured using the form of construction shown, a U shaped box and cover measuring 15 cm long, 8.5 cm high and 8.5 cm in width.

An ordinary ¼ inch solid coupler is used on the capacitor shaft inside the VFO box and a plastic rod should be used to connect the capacitor with the drive mechanism. A number 3 knitting needle is exactly ¼ inch in diameter.

The entire box is mounted on four ¼ Whit screws which are secured to the main exciter chassis through four rubber grommets which provide some mechanical, electrical and thermal insulation. A considerable improvement in stability can be obtained by enclosing the VFO box in one inch thick

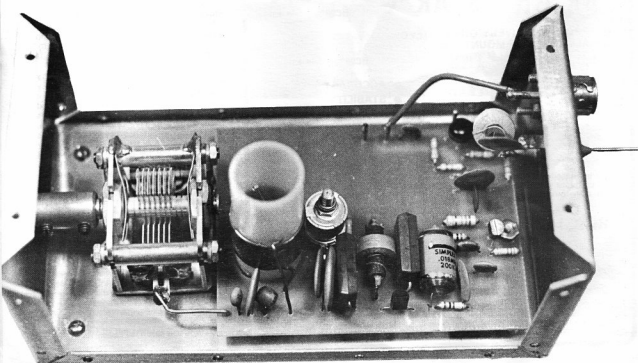

polyfoam insulation. The coax from the VFO output socket provides the earth return for the supply.

The capacitors used at C4 and C5 are ceramic N750 type for frequency drift compensation. The values shown were arrived at after some experimentation with temperature versus frequency. It will probably be necessary to find the exact amount of capacitance by similar experiment. If the frequency increases with temperature, there is too much negative capacitance, if the frequency decreases with increasing temperature, there is too little. Use C2 to restore the correct frequency range. Remember to give the components time to reach room temperature after soldering before taking frequency measurements. If a very stable VFO is required, you must be prepared to spend some time in determining the exact amount of capacitance required.

The author spent considerable time experimenting with various types of coil formers and fixed capacitors in the tuned circuit. A good quality ceramic coil former is ideal of course, but here in Melbourne there appears to be no ready supply. The former finally used was a WYNNE ¼ inch available at Magrath's.

An output waveform which is distorted may be traced to a FET which has too much gain.

As 2N3819's have considerable parameter spread, it may be necessary to try a few FET's in order to obtain a clean output waveform.

IMPORTANT NOTICE

As announced in "Amateur Radio" individuals may apply to the Department of Customs and Excise for By-Law on a H.F. Transceiver.

We will be glad to assist with your transceiver requirement from the Yaesu range. All we need is your By-Law Certificate and a written authority to use it for By-Law admission of the transceiver of your choice from our bulk imports, either when a shipment arrives or from bond storage. Immediate delivery cannot always be guaranteed, but perhaps this is a small price to pay considering the Duty concession.

The following Duty Concession prices are based on previous shipments and are subject to change without prior notice.

FT-75	\$237
FT-200	331
FT-101B	579
FTDX-401	550
FT-501	605

Orders through our interstate agents should be addressed to Bail Electronic Services, but may be negotiated through the agent concerned.

All sets still pre-sales checked, personalised warranty, after sales service, and spare parts availability for our customers. If these things mean anything to you, then why not contact us for the best deal in personalised amateur radio service.

Duty concession does not at present apply to separate power supplies.

Prices of these as follows:—

FP-75	\$49
DC-75	49
FP-200	90
FP-501	90
DC-200	135

VFO for FT-75 (Model FV-50C) \$45

Subject to the model of transceiver desired, we will be pleased to provide forms for a By-Law application together with the required information, on receipt of your order with deposit (20% of concession prices shown).

All prices include sales tax. There are **NO** hidden extras

Newcomers Notebook

with Rodney Champness VK3UG

44 Rathmullen Rd., Boronia, Vic., 3155

The Transistorised Signal Injector: How it works.

Last month I said that an audio oscillator, like the YRCS one described last month, also produces RF signals. If you are new to electronics you could be excused for thinking I'm talking through my hat. Not all audio oscillators produce RF signals, thank goodness. The conversation this time will concentrate on the multivibrator type of oscillator, such as the unit shown in Fig 1 of September 73 "Newcomer's Notebook".

Consider that transistor TR1 has a Beta of 100 and TR2 a beta of 80. Beta can be very roughly equated to gain, meaning that 1mA of base current in one transistor will cause 100mA to flow through the collector junction. There are other factors which come into this but for the purpose of this explanation I will keep it fairly simple. When the multivibrator has supply voltage first applied, TR1 draws slightly more current than TR2 because of its higher beta. This means that the voltage at the collector of TR1 will be lower than TR2. This also means that the voltage across C3 is more negative going than across C2. Negative going doesn't mean negative, it means going in a negative direction with its positive potential decreasing or if already negative, the negative potential is increasing further. The negative going voltage across C3 causes TR2 to be biased off. In other words the voltage applied via C3 to the base of TR2 nullifies the voltage applied across R3. As TR2 is being cut off the voltage at the collector is positive going and is applied via C2 to cause TR1 to turn on harder to the point of saturation.

With TR1 turned on hard and TR2 cut off a temporary state of quiescence is reached. C2 is initially uncharged when TR2 is cut off and as such has no voltage across it. Therefore the base of TR1 can be considered to be at full + potential. As the capacitor C2 charges via R2 the base forward bias decreases. C3 is gradually discharging at this time and the base of TR2 is gradually coming away from deeply inside cutoff. When the base of TR2 reaches conduction point at about 0.6 volts a small amount of collector current is drawn. This will mean that the voltage at the collector will be slightly less positive and a negative going pulse will be transmitted across C2 which will pull TR1 just slightly away from saturation. Therefore the collector voltage will rise going slightly positive. This positive pulse is transmitted across C3 causing TR2 to draw more current so lowering its collector voltage. This causes an increase to the size of the negative going pulse applied via C2 to TR1 which is

progressively cutting off TR1. This regenerative action continues very quickly until TR1 is cut off and TR2 is conducting into saturation. Changing over from conduction to cutoff can be accomplished in a microsecond or so. The length of the quiescent state, though, is controlled by the time constants of the resistors and capacitors used in the device.

In essence the multivibrator just discussed is a square wave generator. Square waves in fact can be mathematically shown to contain all frequencies which are harmonically related to the fundamental oscillation frequency. Therein lies the clue of how an audio oscillator can produce an RF signal. The waveform of the multivibrator isn't quite a square wave so its output does diminish as the frequency rises. A typical output waveform is shown in Fig 1 of this issue. The unit under discussion will give output to at least 2MHz. The higher in frequency you go the less the output there is from the unit.

FIG. 1

How to Use the Signal Injector.

The signal via the probe can be injected into any audio signal circuit by placing the probe onto any part of the signal path through the amplifier. If placed on the speaker don't expect to hear a loud noise, in fact you will barely be able to hear it at all. The base or grid of the last audio stage will produce higher volume, and the base or grid of the preceding stage considerably more. Once you get to the diode detector the volume may be slightly down on what you obtained at the input of the following stage. If you now start to work your way towards the front end of the set you will find the level of the output from the speaker increases. At the collector or plate of the last IF stage you will find that the output is quite low after having been high in the first stage of the audio section. The reason for this is that the probe has a much lower output at RF frequencies than at audio. As you once again progress towards the front of the set the level of signal should once again increase.

To get the hang of the multivibrator signal injector, it is desirable to try it on several sets both valve and transistorised. You will get an idea of the level of signal that can be expected in various stages by doing this. One point I wish to bring to your attention again is the one I mentioned last month, namely NEVER use the earth lead when you are putting the probe onto a point of high potential above earth.

The multivibrator signal injector is a very handy instrument for the amateur and for the professional radio man. I consider that this is one of the handiest "dynamic" testing instruments for the amateur shack. This particular article wasn't written on test instruments as such, but has ended up being a

write up of a particular instrument. Other instruments will be written up soon. One method of increasing the output from the signal injector is to increase the supply voltage. Subminiature batteries giving up to about 6 volts could be used, and considering the current drain should last a long time. At 6 volts the current drain would be in the order of 4 mA.

Another method of obtaining output at higher RF frequencies would be to replace the transistors used with transistors known to be good at HF and possibly VHF. The switching time from cut-off to saturation and vice-versa is likely to be shorter with the HF or VHF transistors. This means the front and back slopes of the "square" wave output are steeper so causing more of the higher harmonics to be produced. It is possible to do quite a few experiments with these multivibrators until you get the results you want. The multivibrator that has been discussed is called an "a-stable multivibrator", there are two other types "bi-stable" and "mono-stable". The latter two are used extensively in digital electronics.

Notes

Last month I hope to describe some accessories for converted domestic mantle receivers. I promised it about a year ago, so it is about time. The planned low power 160 or 80 metres transmitter hasn't as yet got off the drawing board. It will, but regrettably will be delayed a few months.

3 Fairview Ave., Glen Waverley, 3150

After looking at the FT 101 over the last two months, we are now going to step back a few years to the 101's predecessor, the FT 100. Many of these rigs are still giving excellent service and can often be obtained on the second hand market at quite reasonable prices.

The service data that follows is again due to the generosity of Mr Fred Bail of BF Electronic Services.

SYMPTOM. Low kick-up on speech. Meter kicks normally on whistle or high pitched sounds.

Probable cause. Earth point of emitter bypass on TR 308 (first mic amp) not earthed (C322).

Cure. Resolder the condenser leads.

SYMPTOM. Cross modulation.

Probable cause. Protection diodes D106-D107 incorrectly positioned in circuit.

Cure. Check that the diodes are on the receiver side of trap L608 as shown on the circuit. If they are on the antenna side, B C break-through will then result.

SYMPTOM. Oscillation in the IF stage.

Probable cause. Coupling between IF transformers 1, 2 and 3. Coupling can occur between the tuning slugs.

Cure. Screw slug through to bottom side of one coil only, instead of top side for resonance as is normal.

SYMPTOM. Receiver very weak.

Probable cause. Dry joint at band switch to cill.

Cure. Resolder condenser. Also check RF transistor TR 101 and alignment.

SYMPTOM. Intermittent operation for all but CW-Tune position.

Probable cause. Stress on chassis could cause short with coax braid and mode switch lug.

Cure. Adjust stress on chassis. Check that no leads or wires are jammed under control fixing nuts etc.

SYMPTOM. Delay too short in VOX operation.

Probable cause. Lack of capacity in timing circuit or resistance too low.

Cure. Check value of timing resistor. If low, replace, or if OK, add extra capacity to delay circuit.

SYMPTOM. AM modulation downwards.

Probable cause. Poor SWR.

Cure. If unable to reduce the SWR try adjusting the IC on AM for best upward modulation.

SYMPTOM. Pulling or FM-ing of VFO on voice peaks.

Probable cause. Defect in voltage regulator causing slight variation in regulated voltage of VFO.

Cure. Check VR components. Check that VR circuit has correct input voltage. If fault exists only when operating on 12 volt DC power supply, check that battery voltage is normal. Excessive Mic Gain with resultant high peak current on speech can result in VFO FM-ing.

SYMPTOM. VFO OK on receive, but drifts on transmit.

Probable cause. Faulty conductivity in RFA circuit, probably via relay contacts in RL 301.

Cure. To check this, try interchanging the plug-in relays RL 301 and RL 302. Clean the relay contacts and retension the springs.

SYMPTOM. "S" Meter reads high on SSB with no signal input.

Probable cause. Oscillation in IF stages or carrier leakage in IF.

Cure. Check IF alignment. Check carrier oscillator (BFO on receive) and adjust to correct frequency. Also check transmitter carrier null.

SYMPTOM. No drive on transmit. Receive OK.

Probable cause and cure. Diode D304 open circuit. replace.

SYMPTOM. Little or no "S" meter reading. Meter reads OK in transmit mode.

Probable cause. Meter circuitry defective.

Cure. Check relay RL301 contacts that change over the meter functions. Clean and retension. Also check "S" meter transistor TR205.

SYMPTOM. Advancing RF gain beyond half scale causes volume to decrease and "S" meter to rise. (Voltage on AGC line rises).

Probable cause. Zener diodes at RF amplifier emitter reversed or open circuit, or not properly soldered in.

Cure. Check diodes and resolder.

SYMPTOM. Receiver audio output distorted.

Probable cause and cure. Output stage transistors faulty. Replace both 2SB200 output transistors.

SYMPTOM. No output or very low output on transmit. Preset/tuning broadly and incorrectly.

Probable cause and cure. Fault in driver stage. Replace RFC L119 plate feed to I2B7. This choke can overheat and become distorted although not actually burnt out. Turns can apparently become short circuited. Aegis type CA is a suitable replacement.

SYMPTOM. Oscillation in the receiver RF amp.

Probable cause and cure. Excessive gain in the RF section. Try connecting a 22K ohm resistor across the RF coil.

Y.R.C.S.

with Bob Guthrielet

Methodist Manse, Kadina, S.A., 5554

A few weeks ago I received a letter from N. H. Hyde, (VK6NH) informing me of his appointment as the Supervisor of YRCS in WA. In offering our congratulations, we respond to his SOS for assistance in terms of which I quote: *I have recently taken over*

the Co-ordination of the Youth Radio Scheme in WA, and would be grateful if you could make this known in Amateur Radio. As my records are somewhat incomplete, I am anxious to hear from any individual or organisation involved with the Youth Radio Scheme in WA. I can be contacted — Hamilton Senior High School, Purvis St, Hamilton Hill, WA, 6163 (Tels. 37 1740, and 67 Hennessy Avenue, Orelia, WA, 6167. (Please help if you are able).

Another important item is that referred to in a letter from Rex Black, VK2YA, Rex emphasises the importance of club members being given guidance when appearing for interviews for jobs. Suggestion is that the potential employee should take a suitcase with his best electronic project, and demonstrate and discuss it from the technical point of view. Will club leaders consider this idea?

Have received a copy of the YRCS News Release Sheet published by the VK2 boys under the guidance of Kev Watson. This is something which could be profitable in all States and enable supervisors to keep in touch with the clubs under their control.

It is now over ten years since the formation of YRCS and with many of our testing problems overcome, I believe the time has come when we should accept some responsibility for helping ourselves financially. The present situation is that we are dependent on local WIA Divisions and FED. WIA for support which has been waning. On the Federal level, YRCS has to rely on help to cover the cost of postage, stationery, telephone, etc. If the 200 clubs in Australia contributed the small sum of \$1 per year, we could establish a fund which would enable us to function more efficiently. Will State Supervisors think about this suggestion, and act accordingly?

AARTG

with Ken Kelly VK4MJ

285 Monaco Street, Surfers Paradise, Qld., 4217

During August, meetings have been held in Brisbane and Perth, resulting in the formation of the new Australian Amateur Radio Teleprinter Group. Although the constitution has yet to be ratified by the W.I.A., it seems that the new group is now off the ground.

The first meeting was held in VK6 early in August, and there were already 15 members. The secretary is Alan Gibbs, VK6PG, 12 Munyard Way, Morley, W.A., 6062, and interested persons in that area should get in touch with him. The members to date are VK 6 — VW, WA, PG, NT, NE, KR, IX, IQ, HK, CW, LF, VK, NK, QJ, and AND JR. The state chairman is VK6NT.

Late in August a meeting was held in VK4, and was attended by 12 hams. It was decided to form the VK4 Divisional Group, and a provisional constitution was agreed upon. This will be considered by the VK6 group and when agreed upon by both groups, will be forwarded to Federal Executive of WIA for approval.

It has been noted that there is now some activity in VK5, and we hope that it may be possible to form a group there also in the near future. In VK3 and VK2 those active on RTTY appear to rather favour joining a new RTTY group being formed by the Eastern & Mountain District Radio Club of Victoria. While we are disappointed that there is some fragmentation of the RTTY interest in this way, we are pleased that there will be an active group operating, and hope that the two bodies will be able to co-operate to the advantage of both.

We have reason to hope that a large number of page printers may become available shortly, and that many who are interested in this mode will be able to join the ranks. In the meantime, we will try to populate the RTTY frequencies in use, and be able to find more stations to work within Australia than has been possible up to the present time. Frequencies most likely to be active at the present time are: 3590, VK6 net on Mondays at 0001Z, 3540, 7005, 7040, 14085 to 14095. A general net is at present held at 0600Z, Sundays on 14085kHz.

Anyone who is interested may receive further information by writing to the address given at the head of this column, and all enquiries will be welcome. Those who wish to join, and who reside in a State in which a group has not yet been formed may be attached to the group of another State for the time being.

DICK SMITH ELECTRONICS PTY. LTD.

ELECTRONIC & COMMUNICATION ENGINEERS

NEW CATALOGUE

Dick's new 64-page catalogue in the October Electronics Australia is a must for all hobbyists. You need a copy just for the data in it—some 20 pages including: Amateur information, IC data giving the inside circuits of popular Digitals and applications info on Linears, plenty of circuits and full specs on many items. Plus the usual 50 cent discount vouchers and a Newsletter offer. The new 64-page catalogue is available for only 30 cents (if you can't get Electronics Australia) mail us the coupon NOW.

SUPER KIT FOR 144MHZ FANS

Build your own 30 Watt power stages. All the parts including power transistors, circuit boards, special trimmers etc. Transistors are from U.S. Solid State Scientific and are being used by leading VHF mobile manufacturers here. They are virtually indestructible and withstand severe VSWR. Guaranteed to give 30 Watts from 12.6V supply, even more on 13.5V. Full data in our new catalogue.

Complete kit giving 30W out from 300mW input. Only \$37.50, saves \$5 on buying the stages separately.

Stage 1, 7watt complete	\$11.50	Stage 3, 30watt complete	\$17.50
P.C. Board only	\$1.50	P.C. Board only	\$1.50
Transistor only (2N5589)	\$6.50	Transistor only (2N5591)	\$9.85
Stage 2, 15watt complete	\$13.50	Transistor package offer	
P.C. Board only	\$1.50	2N5589, 2N5590, 2N5591 for	\$22.50
Transistor only (2N5590)	\$7.75	All P&P 50 cents	

Data sheets on transistors available separately 10 cents (P&P 20 cents). The prototype shown here was built by Dick Smith himself. It worked despite a few short circuits. If he can get one going anyone can!!

World famous Redpoint heatsinks improve reliability. Did you know every 10°C rise over 50°C halves reliability?

Type 5F for 10-5 transistors. Thermal Rating 50°C/Watt	25 cents each	Type T2 for T0-3 transistors. Thermal Rating 10.5°C/Watt	60 cents
Type 18F for T0-18 transistors. Thermal Rating 80°C/Watt	25 cents		

POWER HEATSINKS

W type in 2" lengths at	\$1.25	Measure 1 1/4" high by 5.12" wide.	
W type in 3" lengths at	\$1.75	ratings are 1.9, 1.5 and 1.3°C/Watt	
W type in 4" lengths at	\$2.20	respectively.	

Dick please send me a copy of your new 64-page catalogue. I enclose 30 cents towards post and packing.

The CW Net — (Continued from page 9)

the going rough at present. The simplicity of the concept offers to any group the opportunity to form a net to suit themselves.

There are still a fair number of CW operators active today, but it seems that their numbers are not growing. Possibly the convenience of SSB has wooed many away, or perhaps it is just another facet of the trend today to give in when the going gets tough, and CW is tougher to master than phone operation. What the CW Net philosophy offers is an opportunity for those radio

amateurs who would like the chance to have on-the-air practice to get some without fuss. It encourages proficiency which is an end in itself and helps alleviate the bandwidth problem which, despite the improvement brought about by SSB, offers a further four-fold improvement. For the casual QSO where speed of communication is generally irrelevant, CW says it as well and offers the added satisfaction which comes to those who can do something which apparently others cannot.

It has been suggested that if the world population growth rate were applied to the

radio amateur population, within 20 years there would not be space available for voice communication in the medium frequency bands. Will that day sound the death knell for the hobby? I think not. It is more likely that the CW operator will continue as he always has enjoying the fruits of his efforts and the pleasure of his hobby.

It is the aim of the CW Net activity to offer the opportunity for more CW activity on the bands now. The author would welcome comments on this article and extends to all operators the invitation to listen in to the CW Net and judge it for themselves. ●

SIDEBAND ELECTRONICS ENGINEERING

For the time being we now know where we stand with respect to the BY-LAW import duties exemption on HF transceivers. A firm order, 50% deposit, three photocopies of the footsack size amateur stations license and the paperwork will be done for you! There is a 3 to 4 weeks delay and sets are mostly in stock in bond-storage, although not always as at my prices it is hard to keep up with the demand!

Meanwhile, many prices of equipment have gone up overseas. CDR rotators, HY-GAIN antennas by almost 10%, BARLOW-WADLEY XCR-30's have to be paid in South African Rands that now are 7 per cent dearer than before. As a result the benefit of the reduced import tariffs has all but been nullified again. Sorry, INFLATION is a world-wide disease! Here we go:

YAESU MUSEN FT 101 complete with CW filter, cooling fan, crystals for all channels, 160 Meters down **\$560**
 FT DX 401 **\$480**
 FT/FP 200 combination **\$340**
 YC 355 D digital frequency-counter 0-200 MHz **\$250**
 SORRY, all FT 2 FB 2 Metre sets sold out.
 FT 101 CW filters **\$30**
 FT 101 cooling fans **\$20**
 FT DX 400/560/401 noise blankers **\$20**
 FT 101 (older models) conversion kits **\$50**

MIDLAND PRODUCTS model 13-869 CB 23 channels **\$90**
 5W AM 12 V DC **\$90**
 Model 13-894 CB 5W AM-10W SSB 23 channels 12V **\$175**
 Model 13-856 5W AM 27880 kHz 12V DC for marine operations, with microphone **\$75**
 Model 13-700-S 1W walkie-talkies 27240 kHz **\$40**
 One Watt De Luxe model walkie-talkie **\$50**
 SWR meters 52 ohm twin-meter type **\$16**
 SWR meters, single meter type also FS-Metre **\$12**
 PTT hand-held 50K ohm dynamic microphone **\$10**
 Crystals for various 27 & 28 MHz channels p.pair **\$3**

BARLOW-WADLEY XCR-30 Mark II continuous coverage receiver 500 kHz to 30 MHz, crystal controlled, still only **\$225**

Large Selection of HY-GAIN ANTENNAS
 14 AVQ vertical, no guys required, 10 to 40 M 18' tall **\$45**
 18 AVT WB vertical, no guys required, 10 to 80 M 23' tall **\$85**
 TH 3 JR 10 15 20M. 3 el. Junior Yagi beam 12' boom **\$100**
 TH 3 Mk 3 10, 15, 20m. 3 el. 1 KW Yagi beam 14' boom **\$145**
 TH 6 DXX 10 15 20 M. 6 el. 1 KW Yagi beam 24' boom **\$175**
 HY-QUAD 10 15 20 6 element Cubical Quad 8' boom, single feedline **\$130**
 204-BA 20 M. 4 element 1 KW Yagi 26' boom **\$155**
 BN-86 Hy-Gain balun only for buyers of Yagi beams **\$18**
 Baluns of local production, excellent finish **\$15**

CDR ANTENNA ROTATORS
 AR 22 R **\$40**
 HAM-M senior **\$130**
 Both with 230 V AC Indicator-control units

All prices quoted are net, cash with orders, basis Springwood N.S.W., sales tax included in all cases, subject to changes without prior notice. Freight, postage, packing & insurance are extras, sorry, no terms, credit or C.O.D., Proprietor Arle Bles.

144-148 MHz EQUIPMENT

KEN PRODUCTS KP-202 144-148 MHz 2 Watt output hand-held transceivers, with the hottest receiver of the lot, bar none, provision for 6 channels, crystals for 4 channels provided, 144.48, 144.60 plus a choice of channels A or B and Repeaters 1 or 4 **\$150**
 Extra crystals, per channels **\$8**
 10 NI-CAD batteries with KEN battery charger **\$35**

BELCOM LINER 2 Solid State 144 MHz SSB transceivers, 10 Watt output, 12 V DC operation VFO coverage 144.000 to 144.240 and 144.240 to 144.480 MHz, with clarifier, noise blanker, squelch, mobile bracket and P.T.T. microphone, 27 transistors, 6 FET's one I.C. and 44 diodes **\$330**

SWAN TV-2C 144 MHz transverter, 28 MHz input, 240 Watt PEP output on SSB, receiver convertor noise-figure less than 3 db with two FET r.f. stages and FET mixer, 5894-B transmitter output stage, to be powered externally from the supply of the driver-transceiver **\$430**

SWAN VHF-150 144 MHz linear amplifier, 150 Watt input on carrier, with only 2 Watt drive, built-in 240V AC power supply, with input-output relays to by-pass linear on reception, optional Class C operation for FM and CW or Class B operation for SSB, twin-tetrode RCA 5894-B **\$375**

YAGI ANTENNA 9 elements 144-147 MHz, 9' boom with gamma-match fed radiator, perfect 52 or 75 ohm match, locally produced, complete **\$30**

POWER OUTPUT METERS

GALAXY RF-550-A 0-4000 and 0-4000 W in line meters, with 6 position built-in coax switch **\$75**
SWAN VM-1500, 4 ranges 5 to 1500 Watt rf power in line meter **\$50**

NOISE BRIDGES OMEGA T antenna noise bridges, 0-100 MHz indispensable for intelligent antenna work, still only **\$25**

9 MHz CRYSTAL FILTERS with 2 USB/LSB carrier crystals, response curve and instructions for use per set **\$30**

TUBES

6KD6 Hitachi brand **\$6.50**
 6JS6 German, few left **\$5**
 6LF6, super type 6JS6 or 6KD6 **\$7.50**

TEN-TEC ARGONAUT 10 to 80 Metre 12V DC transceiver 5W PEP SSB & CW, one sample only **\$200**
 Model 315 receiver, 10 to 80 Meter, with sharp CW filter 110 V AC operation, one sample only **\$175**

USED EQUIPMENT All in mint condition

DRAKE TR-4 with factory installed US \$120-noise-blanker RV-4 external VFO-speaker and 240V AC supply **\$500**

STC 25W output 2 Metre FM transceiver model WVT-25 12V DC operation, with PTT mike, crystals for channel B and Repeater 4 **\$150**

COLLINS 618 T 400 W SSB/AM transceiver, 29,000 channels with automatic antenna tuner at fraction of new cost **\$1500**

ALSO Ex RAAF 110 ft 10-section telescoping aluminium tower **\$450**

Contests

with Peter Brown VK4PJ

Federal Contests Manager, G.P.O. Box, 638
Brisbane, Qld., 4001.

Ross Hull VHF HF Memorial contest 1973/4 rules

CONTEST CALENDAR.

October 6, 7. VK-ZL Oceania 'phone Contest. Our International Contest.
October 13, 14. VK-ZL Oceania 'phone Contest. Do your bit.
October 13, 14. RSGB 21-28 MHz 'phone. 'phone.
October 21, 21. RSGB 15 MHz CW.
October 27, 28. CQ WW DX CW Contest. One of the best.
November 3, 4. RSGB 7 MHz 'phone.
November 11. Czechoslovak Central Radio Club Contest. Rules next month.
November 24, 25. CQ WW DX CW Contest. Plenty of practice here.
December 22, 23. Hungarian Contest.
October is one of the best contest months of the year. If one works hard I am sure they would achieve DXCC.

C Q World Wide DX Contest.

C Q World Wide DX Contest.
November 27, 28. CW November 24, 25.
Starts 0000 GMT Saturday. Finishes 2400 GMT Sunday.

All Bands, 1.8 through 28 MHz.
Exchange RS-RST plus your CQ Zone.

QSO point value.

3 points between stations on different continents. 1 point between stations on the same continent but in different countries.

Contacts between stations in the same country are permitted for Zone and/or country multiplier, but have no QSO point value.

Final Score.

(a) Single band. Zoning plus countries by QSO points.
(b) All band. Sum of Zones plus sum of countries from each band by total QSO points.

Three Divisions.

Single Operator, single or all band.

Multi-operator, single transmitter.

Multi-operator, multi transmitter.

Use a separate log sheet for each band. 40 contacts per page.

Indicate Zone and Country only the first time each is worked on each band. Logs to CQ World Wide Contest, 14 Vandeventer Ave., Port Washington, LI, NY, USA, 11050. Usually Dec. 1st and Jan. 15th deadlines. Times GMT. Summary sheet giving all details.

Going metric?

Herewith is the Ross Hull scoring table with two metric conversions. One column which we will call "A" converts fairly closely but is not rounded off as well as "B".

Perhaps you have some better ideas which I will be pleased to hear. When you return your contest log put in an "A" or a "B" to indicate your preference, but please do not consider just yourself. Consider what is best for the majority ... and give an opinion.

Distance	Miles.	Kilometers	"A"	"B"
Up to	25	40	50	50
50	80	100	80	100
100	160	200	160	200
200	320	400	320	400
300	480	600	480	600
400	640	800	640	800
500	800	1000	800	1000
1000	1600	2000	1600	2000
1500	2400	3000	2400	3000
2500	4000	5000	4000	5000
3500	5600	7000	5600	7000
5000	8000	10000	8000	10000

Remembrance Day Contest.

How did you find the Remembrance Day Contest this year? The opening ad was received OK this year at this QTH without any QRM.

I thought that it was a pretty slow start; my first 4 contacts were 2Ls, but it soon developed into the same great contest ... must be the world's best! I only made local on 10 metres and I don't think I was so good. VK5s were going great guns; VK8XQ Doug, having a ball, VK4VU and VK4EQ working well; VK7JL, Greg was among the leaders I heard, D 9 will hear much from VK3 but I guess that VKs 2, 3, 6 & 9 will show up well in the final results.

I received over 100 logs in the first week from Camarvon to New Guinea.

The Wireless Institute of Australia invites Amateurs and Short Wave Listeners to join in this annual Contest which is held to perpetuate the memory of Ross Hull who did so much to further VHF-UHF.

A Perpetual Trophy is awarded annually for competition between members of the Wireless Institute of Australia and is inscribed with some details of the man the contest honours.

The name of the winning member of the Wireless Institute of Australia for each year is inscribed upon the trophy and that member also receives a suitably inscribed certificate.

Objects. Amateurs from Australia and Territories will endeavour to contact as many other Amateurs as possible under the following conditions.

Date of Contest. 7th December, 1973 1401 GMT, to 20th Jan. 1974, 1400 GMT. 0001 Hours E.A.S.T. 8th December 1973 to 2400 Hours E.A.S.T. 20th Jan. 1974.

Duration. Any seven calendar days within the dates mentioned above which need not be consecutive. These periods are at the operators convenience. A calendar day is from 1401 hrs GMT to 1400 hrs GMT.

RULES.

1. There are two Divisions, one of 48 hours duration and the other of seven days duration. In the seven day division there are four sections:

(a) Transmitting, open.

(b) Transmitting, phone.

(c) Transmitting, C.W.

(d) Receiving, open.

In the 48 hours division the best score over any consecutive 48 hour period is the winner.

In the seven day division the best score over any seven days of the Contest is the winner.

2. Any Amateur operating fixed, mobile, or portable within the terms of his licence may participate.

3. All Amateur VHF-UHF bands may be used but cross band contacts are not acceptable. At any one time, single frequency operating only is permitted. Cross mode contacts are permitted.

4. Amateurs may enter for any one of the sections and either or both divisions. The seven day division winner is not eligible for the 48 hour division award.

5. Two contacts per band per day, irrespective of mode, are permitted provided that two hours elapse from the previous contact with that station on that band.

6. Logs from a multi-operator station are not acceptable. One operator only may operate a station at any one time and must submit a log for his own operation.

7. Entrants must operate within the terms of their licence.

8. The exchange of RS or RST reports with serial numbers beginning with 001 shall be proof of contact.
9. Entries should be set out on quarto sheets, using one side of the paper only, and must be forwarded to reach the Wireless Institute of Australia, Federal Contest Manager, GPO Box 638, Brisbane 4001, in time for the last opening of logs on Friday 22nd February 1974. Envelopes should be clearly marked "Ross Hull Contest". Early logs are appreciated.

10. Scoring will be based on the attached table and the table of distances published in the Contests column of this issue of AR. Approximate distances are to be shown in the log. Operation via repeaters or translators is not permitted.

11. Logs should be set out as in the example and must carry a front sheet with the following information:

Name
Address

Section
Call sign
Claimed 7 day score

Operating dates
Highest 48 hour score

Operating period
I hereby certify that I have operated in accordance with the rules and spirit of the contest

Comments

12. All times are to be logged in GMT only.

13. Certificates will be awarded to the winners of each section of each call area. Certificates will be awarded to contestants who break any Australian VHF-UHF distance records.

The VK Contestant who returns the highest score in the transmitting section and who is a member of the VWA will have his name inscribed on the trophy which will be held by his Division for the prescribed period.

A certificate will be awarded to the operator with the highest 48 hour score.

RECEIVING SECTION.

1. Short wave listeners only may enter for this section.

2. Contest times and logging of stations will be the same as for the transmitting section except that there will not be a 48 hour Division.

3. Logs must show the call sign of the calling station, the serial number given, and only the call sign of the other station. Scoring will be as for transmitting stations.

4. Any scoring contacts may be logged. There is no limit to the number of times that a station may be logged provided serial numbers are given.

5. The logs for any 7 days (calendar) may be submitted and the winner of the section will be the highest scorer.

6. Certificates will be awarded to the highest scorer in the section and if sufficient interest is shown, to State winners.

7. A certificate will be awarded to the club station with the highest 7 day score.

General

It is preferable that complete logs be submitted as an aid to checking but contestants must clearly show their best 7 days or 48 hours. Enjoy yourself in another Friendly Contest. Try and exchange names with each contact.

SCORING TABLE

Distance	32 Mhz.	144 Mhz.	420 Mhz.	576 Mhz.	576 Mhz.	1000 Mhz.
Up to 25 miles	1	1	2	5	10	25
26 to 50 "	1	1	1	5	10	25
51 to 100 "	5	5	15	30	50	50

Awards Column

with BRIAN AUSTIN VK5CA
P.O. Box 7A, Crafs, SA, 5152.

The following Awards are offered by JARL to any HAM or SWL in the world in his amateur life. The applicant must submit QSLs fulfilling the conditions of the Award applied for, and a list showing the date and time (GMT) of QSOs, type of emission and frequency used, signal report, and location of the stations contacted.

All claims for these Awards should be submitted by the submission of the QSLs, together with the list as mentioned above, and ten IRCs for each certificate except HAC which requires five. If the list has been certified by the Awards Manager of an IARU member society, confirmations (QSL cards) are not required to be sent. Address for the application: JARL Awards Manager, P.O. Box 377, Tokyo Central, Japan.

All contacts between HAMs or reported by SWLs must have been made on and after 30th July 1952. Any authorised amateur band and type of emission may be used, but no crossband contacts will be allowed. The applicant must have worked under their local regulations. All contacts must be with "land station". Contacts with ships, anchored or otherwise, and aircraft do not count. All stations must be contacted from the same call area, where such areas exist or from the same country in cases where there are no call areas.

REQUIREMENTS

ALL JAPAN DISTRICTS: QSO with all JA-JH-JR-JE call areas, 1 through 6, SWL-AJD for SWLs.

WORKED ALL JAPAN PREFECTURES: QSO with JA-JH-JR-JE station in All (47) Japanese Prefectures shown in the attached list. HAJA for SWLs.

JAPAN CENTURY CITIES: QSO with over 100 JA-JH-JR-JE stations in different cities in Japan. JCC-200, -300, -400, -500, -600 are also issued as separate Awards. A list of cities is available on your request (3 IRCs needed). SWL-JCC for SWLs.

HEARD ALL CONTINENTS: This Award is issued to any SWL who gets confirmation of amateur stations in six different continents, for his/her reception reports.

ASIAN DX AWARD: This Award has been instituted to encourage co-operation and friendship of radio amateurs between Asia and other continents of the world. The ADXA for confirmed contacts with 30 different Asian countries including JA-JH-JR-JE (except KA) is available to licensed amateurs everywhere in the world. SWL-ADXA for SWLs. WORKED ALL CITIES AWARD: QSO with JA-JH-JR-JE stations in all Japanese cities. HACA for SWLs. Obsolete cities are not included.

Country list of ADXA.

Jamboree on the air

10TH AUSTRALIAN SCOUT JAMBOREE
WOODHOUSE, SOUTH AUSTRALIA
26TH DECEMBER 1973 - 6TH JANUARY, 1974.
Friday, December 28th, 1973, will be a memorable day for South Australia.

On that day, 10,000 Scouts from all States of Australia and a number of overseas countries, will assemble for the start of the 10th Australian Scout Jamboree.

For 10 days, the South Australian Branch Training Centre, at "Woodhouse", in the Adelaide Hills, will become South Australia's fifth largest "city".

During this time, the South Australian Scout Amateur Station "VK5BP" will be operating from the Jamboree site.

The station will commence transmission at 0230 GMT on Sunday, December 30th and will operate 24 hours a day until 1030 GMT on Saturday, 5th January, 1974.

The station will be equipped with three SSB Transmitters covering all bands, two transmitters will be operating simultaneously on separate bands while the third will be in a "filaments on" condition in case of failure of either of the operating equipments. Each transmitter will operate for 16 hours on air, and 8 hours on standby to give equal usage of all equipment.

The basic operating frequencies will be:-

160 metres	1.819 MHz
80 metres	3.625 MHz
40 metres	7.050 MHz
20 metres	14.190 MHz
15 metres	21.150 MHz
10 metres	28.150 MHz

Dependent on frequency being clear of use.

Propagation Conditions from day to day will determine the two bands in operation.

These Aerial Systems will be in use:-
1. A Rotatable Quad for 20, 15, 10 metres.
2. Dipoles at 90 degrees for 80, 40, 20 metres.
3. Long wire for 160 through 10 metres.
It is hoped that many stations around the world will take part, thus ensuring that the operation of the JAMBOREE Station will be a success.

STOP PRESS

Les Marmo, Victorian Branch Organiser of JOTA passed along an interesting letter by Alan Reid, VK3AHR which was unfortunately received too late for inclusion in this issue. Alan recommends quick short overs. SSB style, with pre-arranged skeds and only "loud and clear" copy—no technical jargon.

CLUB/ZONE/DIVISION NEWS

● The Publications Committee wishes to advise that the call on AR for space to print material is so great it is not possible to include a section devoted to Divisional, Zone or Club news.

● Arrangements were made with all Divisions that such news would appear in Divisional Bulletins if so required, and accepted by Divisional Bulletin Editors. Bulletins, when submitted, are carried as inserts in AR mailed to members of the Division concerned.

● It has been agreed however that AR should include an Events Diary to contain very brief details of forthcoming events. Items for this Diary MUST reach the Editor not later than the 1st of the month prior to publication.

The VK6 VHF Group News Bulletin refers briefly to the new solid state beacon VK6RTT to take the place of VK6VF it has been on test at VK6PD running 8 watts to a ground plane. FSK has been used to minimise keying problems so that a simplified power supply could be used. So far the safety devices have not been completed, but work is in progress on these and the 2 metre unit.

George VK3ASV writes that the Eastern Zone beacon being constructed by Norm VK3ZCZ has now been completed and tested on dummy load, and the new keyer and command receiver are being constructed. The beacon will not be installed until the finance is received and the equipment installed at the 101 km (62.5 miles) VHF station which is 100 miles (160 km) from Melbourne. Thanks for the advice George.

SIX METRES.

Ron, VK4ZL of Townsville writes with information of doings in the North Queensland area. He reports a very successful Convention during July, and mentions much discussion between the Rockley and Townsville boys regarding the possibility of a repeater to cover between the two areas, about 260 miles.

Ross VK4RO at Ayr will be ready for the next DX season, having assembled the Rockley and Townsville repeater and starting same on the 6 metre receiver. This will allow Ross to work anyone who pops up on the first 500 kHz of the band, and will be able to radiate both SSB and FM.

Ron also mentions there is quite a lot of interest in forming a VHF Club in Townsville, and preliminary discussions will be held soon. This may well increase VHF activity in the area so those who hope the Club eventuates. Would like to see some good transmitters in that area capable of operating on 2 metres tuneable, some contacts with southern stations might result during the summer period of the next year or two. Thank you Ron for your letter.

While still on 6 metres I was pleased to receive a letter from Bill VK2IHZ of Springfield with some notes on winter 52.7. There were being few peaks, one I quote: "A letter from Max ZL3ANN confirmed the number of times VK2 I was audible in Ashburton, N.Z., as was ZL TV here in Springfield, often up to 4 hours, July 10 was the day that saw the best viewing both ways across the Tasman. At 1800 Sydney TV was 40dB over 59 and the VK2VI beacon 57, the loudest ever recorded by ZL3ANN. Max wrote that the VK2VI was the best peak he was seeing at 1800 from Monday to Thursday, and Brisbane TV on Friday and Saturday."

"The band opened from VK2 to VK7 from 1730 to 1845 on July 7 and again on 12th from 1050 to 1600. On the same day VK6RTT was also in the air. It peaked at 1715 peaking at 57 dB and faded out at 1810. On 13th the VK7's were again contacted between 1330 and 1540. In fact VK2IHZ was also working into other States during the week. Main activity was on 52.525 FM and plenty of VK7 and VK2 mobiles on their way home from work made good contacts."

Max provides the following off-air frequencies for New Zealand. On 11th TV stations: "Hedgcock near Dunedin 50.750 MHz. Horizontal; Kaukau near Wellington 50.750 MHz. Horizontal; Te Aroha near Auckland 50.740 MHz. Vertical; and Whakapouke near Gisborne 50.760 MHz. Horizontal. All stations run 100 W. ERP."

Many thanks Bill for going to the trouble of writing. News like that is what is needed, it makes good reading even when it is somewhat dated by the time it is eventually published, would like to hear from you again some time.

Whilst still on 6 metres, August "6 UP" has a paragraph of interest regarding long-spheric-meteor scatter operation during the latter part of July.

In VK2 alone, VK2's ZOL, AM, AAG (ex-ZOG), ZVD, ZXL, ZVP, ZAY, BHO and ZTB have worked one or more inter-state stations via m.s. in the past few weeks. All stations use SSB, except of course the editor of 6 UP who takes pride in running (almost) the only AM station left in Sydney. . . . The predicted enhanced meteor activity peaked around July 29 to August 1, and signals were virtually everywhere. On July 30, VK3AM and VK3ANP heard good backscatter returns from VK2AOG, which demonstrates the possibility of working stations inside the forward scatter minimum range via the meteor route. The writer has often heard VK2ZAY and VK2BHO on meteor backscatter.

MOONBOUNCE

The Hawera Branch of the WIA on the South Coast of N.S.W. sent their Newsletter which gives some information on their recent moonbounce activities. It was reported that the usual monthly test with W6FZJ was not as successful as previously, but signals were heard for about 2 minutes. Not being a problem which has developed in the receiving system which results in excessive noise output immediately after switchover to receive, requiring about one minute to return to normal. Much time has been spent in trying to rectify the trouble without result so far.

A check was also made of the circularity of polarisation of the radiated signal following comments from W6FZJ and a previous check at Dapto which indicated that it may be excessively elliptical rather than circular. It was found however, that the maximum variation was 1.2 dB in the field pattern over 360 degrees of rotation, which was considered acceptable.

Preparations for the use of RTTY are continuing. KZUY reports that his 28 foot dish is now up and he hopes to have it operational shortly. He is interested in trying RTTY as well. . . . Thanks Lyle VK2ALU.

News ends abruptly at this point. Concluding with the thought for the month: "The trouble with an income-tax reduction is that it stimulates business just enough to put everybody in a higher tax bracket."

The Voice in the Hills.

ESSENTIAL BOOKS

HOW TO MAKE WALKIE-TALKIES FOR LICENSED OPERATION AS1

PRINCIPLES OF ELECTRICITY & MAGNETISM A complete course on this basic subject for the student, electronics engineer, and amateur who wishes to improve his knowledge. As supplied to Universities, Technical Colleges etc. 532 pages. Hardback. Fully illustrated. Published at AS10. Special offer of AS9

THE GOVERNMENT SURPLUS WIRELESS EQUIPMENT HANDBOOK. Gives circuits, data and illustrations plus valuable information for British/USA receivers, transmitters, transceivers. With modifications to sets and test equipment. Latest impression. AS7

DIRECTORY OF GOVERNMENT SURPLUS WIRELESS EQUIPMENT DEALERS. Gives details of surplus wireless equipment Stores and Dealers including addresses plus equipment and spares that they are likely to have available. A useful book AS1

THE THEORY OF GUIDED ELECTROMAGNETIC WAVES. R. Waldron. Marconi series. The most comprehensive book on this subject yet written. Conveys sufficient understanding of principles and mathematical methods enabling the reader to solve a wide range of problems. Embraces Basic Electromagnetic Theory, The Mathematics of Waveguide Theory, Transmission Lines, Elementary Theory of Waveguides, Cavity Resonators, Inhomogeneous, and Anisotropic Waveguides Over 500 pages. Published at AS22. Available to readers at AS15

NEW BOOKS. Publication date for these titles is Nov. 15th, 1973. Order now to avoid disappointment as the first impression of each is expected to be a sell out.

MOBILE RADIOTELEPHONE EQUIPMENT HANDBOOK. Gives circuits data, and illustrations plus some valuable modifications for commercial radio telephone equipment including PYE and other popular makes. AS8

HOW TO MAKE 2 & 4 METRE CONVERTORS FOR AMATEUR USE. AS1
ADVANCED BOOK OF CRYSTAL SET DESIGNS. AS1

Letters to the Editor

Any opinion expressed under this heading is the individual opinion of the writer and does not necessarily coincide with that of the Publishers.

Dear Sir,

Re "JOTA 15"

I have a suggestion concerning Scouter participation in "JOTA", and would appreciate any publicity you may care to arrange.

I have the approval of our Branch Organiser, Mr Ray Lawrence, and am writing you on his authority.

The idea is to have three, one hour segments, on each of the three nights, Friday 19th, Saturday 20th and Sunday 21st October, 73, from 0900 hrs to 1000 hrs G.M.T.

During these segments, the Adult Leaders — "Scouters" — could feel free to talk to other Scouts, swapping ideas, comparing camps etc., and at the same time gaining valuable experience — which should have immediate value to the "Boys"...

Another point is that I feel there may be some Radio Amateurs who, for one reason or another, have not had, or cannot have a number of Boys, in their "shack" — but who may be delighted to take some part in JOTA. At least, say, a couple of Scouts for one hour!

The Scout Association certainly appreciates the Services provided by Radio Amateurs, and I hope my suggestion will be accepted in the spirit that it was made, to the benefit of all concerned.

We will have Scouts available here at the suggested times, seeking other Scouter contacts, and already have an 80 metre sked with a blind operator near Sydney.

Need I mention that Wauchope Scouts will be on the air throughout the JOTA weekend, and some of our OSO's could again be while mobile.

Yours faithfully,
Jim Griffiths VK2BGG,
Group Leader
2nd Wauchope Group.

The Editor.

Dear Sir,

Concerning an item entitled "Unusual Problems" in QSP Page 9 of July 1973, I can help you with an explanation of the construction methods used on the Baldern Ker T.V. Transmitter project as I was employed as a foreman with the contractors.

The answer to your query is that it was primarily a helicopter-engineering construction project; in other words, helicopters were used as flying cranes and trucks.

All materials for the ropeway towers and the transmitter buildings were flown to altitudes of 5000 feet up the mountain side, the steel towers were rigged by helicopter and a lot of the concrete for foundations was premixed at base camp and poured by helicopters hovering over the formwork.

The power line towers were fabricated in three sections, flown in and rigidly by air. Aerials for the power line and light haul ropes of nylon for the heavier track and haul cables of the ropeway were strung by helicopter.

Operational control of ground and flying operations was by HF & VHF radio telephone and army telephones.

A very interesting colour film by the Commonwealth Works Department is available for conventions and was shown at the recent North Queensland Convention at Townsville.

73
Ted Gabriel
VK4YG.

Dear Sir,

Re. Mobile Whips AR March 1973

Due to the volume of mail regarding the above.

1. Errata Tabulation 1. Could you repeat the tabulation correctly as the feedback has not been noticed; Giving Col. 3 the heading — Diameter Mills instead of Radius.

2. The foregoing dimensions are artist readings from micrometer and rule.

3. The wire sizes are overall sizes including insulation thickness so check the wire size when winding for a suitable gauge; there possibly will be 2 to 8 mils variation in the "standard" gauges available.

4. The criteria as always is wire length so measure off the necessary amount plus and wind that on.
5. Have heard that Estapol may be a good feed electric to use for the coating of whips if you do not wish to shrink sleeve it.

73,
Doug Pannell, VK6EP-VK6SP

Editor.

Dear Sir,
On reading Max Hull's history in a recent "AR" I am reminded of a piece of radio history that is probably only known to a few members.

In 1927 there was a break-away group of Amateurs from the WIA led by Queensland's Leo Fenshuigh. I don't remember his call sign, but he called the break-away "The Australian Radio Transmitters League" (ARTL). In Victoria the VRTL was formed as a branch under the leadership of the late Jack King VK3AJQ (then OAJ3JQ). I was Communications Manager, and under the call sign OAW3W I won an 80 metre communications contest inaugurated by the ARTL in 1928. It was a great occasion when on a last of 22 I was presented with a pennant commemorating the occasion by Leo at the QTH of the then WIA Secretary, Bruce Hardie. It was here that Bruce persuaded Leo to amalgamate with the WIA, and this was done in 1929. Regrettably this pennant along with my other radio equipment was destroyed at Beaumaris in the bushfires of 1944.

Hoping that this is of some interest,
Yours Fraternally,
Aif Chandler, VK3LC.

The Editor.

Dear Sir,

Reference your mention of the availability of slow wave tapes on page 4 of the August issue of Amateur Radio. The following information may be of interest. Source of information: — Page 24 of the March 1973 issue of the N.Z.A.R.T. publication "Break-in"

Details: Morse Course — ZL1HV, 1970. In two sections. (1) eight 1½ hour lessons for teaching Morse code. (2) 1½ hours of practice Morse from 8 w.p.m. up to 16 w.p.m., plus some off-air Morse at high speed. The courses are accompanied with a written guide. There will be more information next month. The lecture service is charged with returning the tape by the due date. Tape lectures required, Recording required (i.e. tape or cassette). One week should be allowed for processing.

Source of information — Page 67 of April 1973 "Break-in"

Details: Morse Course — As mentioned at conference in 1972, this scheme has obtained tapes for teaching Morse code. The course produced by Arthur Godfrey ZL1HV, is grouped into lessons of about 15 minutes, each lesson dealing with a certain group of letters. The whole course is very similar to that presented by Dr A. W. Lewis, ZL3RT in April 1972, Break-in and differing only in the grouping of some letters. The course is designed to teach Morse code, and only a knowledge of basic Morse code characters is required.

Each lesson consists of the characters under study being sent, followed by groups of letters. As each lesson progresses, the letters from the previous page are included in the groups so that knowledge and proficiency is built up as each lesson progresses, to aid recognition of characters at speed, the tapes are made by recording the Morse characters at a speed of 15 w.p.m. but the spacing is twice normal, thus giving the effect of fast characters but with "thinking" time in between.

The Morse course is divided into two parts for convenience. Part 1. Basic Morse course of 8, 15 minute lessons for teaching Morse code. Part 2. Practice exercises, from 8 w.p.m. up to 16 w.p.m. plus some high speed off-air Morse.

Each Part has an accompanying written decode (except for high speed off-air Morse) for checking and correcting copy.

The Morse course is available through the Tape Lecture Service. Note that to keep costs down only one copy of the decode is available with each tape, all extra copies are 25 cents each. Copies of the Morse course are available to any interested person at the following prices: Part 1, 2 hour cassette, 75¢ plus \$6.00. Part 2, 1½ hours cassette or 5" tape, \$4.00.

The information was extracted from The Novice Radio Training Scheme Column compiled by H. Wiggins ZL2BFR, P.O. Box 1718, Palmerston North, New Zealand.

Lionel L. Sharpe, VK4NS.

Finally, I would like to correct an anomaly with the VK4 monthly net as revealed to me here. It seems to be understood that the time is 8 p.m., whereas it is 7.30 p.m. on the first Monday of each month on 3850kHz.

I have been to the North Eastern Convention at Townsville inaugurated by the Townsville Amateur Radio Club, report of which was included in September issue of "AR". As reported it was a success. My identification tape was played to an eager audience as well as a short talk, and I am sure that I have initiated some new observers for VK4. I have submitted for publication in this issue a summary of recurring intruders as extracted from various summaries and they are as hereunder, also an explanation of some of the positive identifications known to me.

Remarks concerning Summary

3DN is a Fijian station located at Nadi airport emitting a spurious from 13095 kHz. Traffic varies, but mostly weather reports for Tonga, New Hebrides, New Western Samoa, Gilbert & Ellice Islands. Calls SWB who cannot be heard on the frequency.

Address by Mr Myles F.E. Wright, Chairman, Australian Broadcasting Control Board, to open the 26th Remembrance Day Contest, August, 1973.

I am very pleased to have been invited to open the 26th Remembrance Day Contest of the Wireless Institute — not least because I notice that it involves amateur operators in Australia and New Zealand. As a New Zealander by birth I am pleased to make a special reference to the operators from Maori land and particularly to any listening in my own home town of Wellington.

Having been involved for about half of my working life in the "professional" side of radio — in front of the microphone as well as behind a desk — I can understand the attraction which radio holds for "amateur" operators. I have heard it said that radio hams could more conveniently (and frequently less expensively) conduct their "natter sessions" using the modern telephone system. I can fully understand their report that it is not the same thing to talk over the telephone to a single captive listener in the third of broadcasting a message to an unseen and unknown audience far transcends the mere telephone call. And in addition, with the true radio "harm" — there is the technical challenge.

I trust that this challenge to investigate and invent new techniques is not completely lost now that such elaborate professional amateur radio stations (if you will excuse the paradox) can be purchased off the shelf as it were. I do sincerely hope that there are still amateurs who are not only building up their own equipment but building it in new ways to operate on the newer wave bands.

It was this technical inventiveness and the thorough technical knowledge which it developed that fitted "hams" so well for the duty so many undertook during War years — too many of them now names on the Remembrance Day trophy.

In my present position as Chairman of the Australian Broadcasting Control Board it would be remiss of me if I failed to use this opportunity to say a few words on the interaction between amateur radio operators and the broadcasting services of Australia and New Zealand.

You are all aware of the dreaded initials "T.V.I." With colour television services beginning in New Zealand in only a few weeks and in Australia about eighteen months, interference from amateur transmissions to television programmes is under careful scrutiny.

The Board's engineers tell me that there is very ready co-operation from "hams" in minimizing interference to television. However, viewers will be investing large sums in their new colour television sets, so we can expect an increase in their reaction to any marbling of quality in their reception.

(Continued next page)

Ionospheric Predictions

with Bruce Bathols, VK3ASE October 73

This month's predictions from information supplied by the Ionospheric Prediction Service Division indicate point to point band openings for at least 50 G.M.T. of the month.

Times are G.M.T.

Instruction Manual, RCA AR8BD Receiver (7.2KHz-30MHz). To buy or borrow, for copying, J. Hams, 1/150 Queen Victoria Street, Bexley, 2207.

My Board is anxious to ensure that viewers derive the greatest benefits possible from the purchase of their expensive colour television sets and the technical staffs of the Board and of the Post Office will be ready to help both the public and the amateur radio operators either individually or collectively through the Wireless Institute in solving the T.V.I. problems which will rise when colour services begin.

The one important advantage which this natural resource possesses, compared with many of the other resources, is that the radio spectrum is irreversibly conserved. It may be mis-used but with wise management and co-operation between users the position can be recovered.

Now, in the case of the spectrum, I believe that the broadcasting users and the amateur radio users have a common complaint that they do not have sufficient channels. At the same time we both must keep our own houses in order to ensure that we use the channels which we do have to the very greatest advantage and that we do not cause trouble to our neighbours. We must develop good housekeeping methods, reduce the amount of pollution or rubbish which we produce and, above all, we must attempt to keep our pollution within our own backyards!

Silent Keys

A. H. Tilse—VK4WO
 R. H. Vickary, VK4VX

W. J. Zech, VK2ACP

Bill passed away on August 9th at Blue Mountains Hospital after a short illness. He was one of the oldest licensed amateurs in Australia, having held a ticket for 61 years. D. A. Cliff, VK2DC

20 Years Ago

with Ron Fisher VK3OM

October 1953.

Tucked away in one of the back pages of the October 1953 issue of Amateur Radio is an article making notice. The Limited AQCP was named as such by the PMG's Department. They stated that where application was made, a Limited certificate would be granted to those candidates who passed the technical and regulations sections of AQCP examinations held since the 1st of January 1953.

Back in the 1950's when plenty of high power transmitting components were available from disposals sources, many amateurs constructed transmitters capable of running well over the 100 watt limit of that time. The 150 watt limit came later. Many of these amateurs, although complying with the law, ran into trouble with PMG Radio Inspectors who would not approve operation of the gear. After Federal representation to the Radio Branch, the following was published: "It is confirmed that the Department will not object to the use of such combined components so long as the final stages of the transmitter is so operated that the licensed input power of 100 watts cannot be exceeded without a major change to the equipment providing the d.c. operating voltages and aerial loading facilities".

The Editorial page for October 1953 was concerned with the 'Status' of the amateur operator in the eyes of the general public.

It was pointed out that most other hobbyists were well known and perhaps understood to some extent by the average citizen, whereas amateur radio operators were looked on as 'radio cranks'. Perhaps even after twenty years we still have a way to go yet to correct this impression.

Technical articles for October included, 'Multi-Band Tuning Unit' by Joe Rogers VK3JO. The system used two tuned circuits, one covering 80 and 40 metres the other tuning 20, 15 and 10. Although the L-C ratio was something of a compromise, the whole thing could be made to work fairly well.

The 'Gamma's Match was described by E. Gabriel VK2AVG and a Simple Low Level Audio Peak Clipper by J. C. Watson VK6JW. The series Connection of Rectifier Power Transformers by V. J. McMillan VK2AWN showed how to use disposals transformers with 110 volt input in series for 230 volt operation.

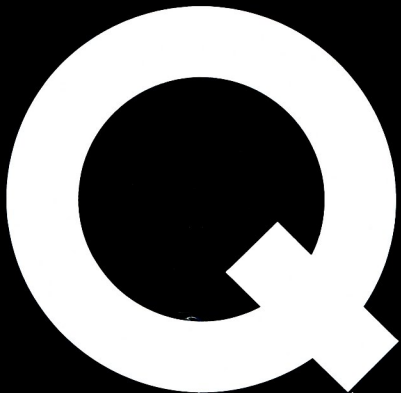

RX activity pages were taken over by Hans VK3AAH for the first time. Fairly good conditions were reported on all except the 15 and 10 metre bands.

As many of you will know, this simple housekeeping in the radio spectrum sense is now being promoted as a specialized topic within the field of radio engineering with the elaborate title of Electromagnetic Compatibility.

No doubt we shall all be hearing a great deal more about it in the future.

In conclusion, let me, on behalf of the broadcasting fraternity in this, our Golden Jubilee year, acknowledge the role which the radio amateurs individually and as a group have played in the development of radio services generally in Australia and in New Zealand. In particular let us recall the important roles your members played, and the sacrifices they made, during the War years.

And now I have great pleasure in declaring on the Remembrance Day Context. I hope it is a very great success.

We didn't name our company Hy-Q for nothing! Our name is self evident to electronic engineers ... of course it means high quality too, and that's what we at Hy-Q Electronics offer.

Backed by a continuous research and development program, we are now the largest manufacturers in the Southern Hemisphere of low and high frequency crystal units, encapsulated in glass, solder seal

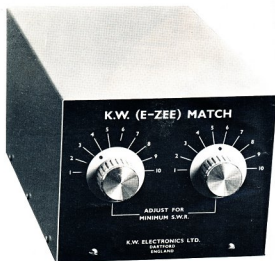

and cold-weld holders. Our range of products includes both discrete component crystal filters and monolithic crystal filters for most communication applications.

Oscillators with output frequencies from 0.1 Hz through to 250 MHz are available from our standard range. We offer applications engineering advice on any of the above products. You name it ... we've got it.

AN EFFICIENT COUPLING UNIT for use from 80 to 10 metres over a wide impedance range. For use with balanced or coaxial feed lines at up to 1KW PEP.

AN ALL IN ONE UNIT Combines an E-Z match, Antenna switch, Dummy Load and SWR/PWR meter for balanced or coaxial feeds. Wide impedance matching range at up to 1KW PEP.

coming soon

THE KW MONITORSCOPE and POWER METER

* Q-Craft SWFS-2 single meter type, combined SWR and FS meter. Includes FS pick-up whip.

* Q-Craft SWR-2 dual meter type offers simultaneous readings of forward and reflected power at 50 ohms.

* Osker SWR-200, large dual meters, is switchable for 50 or 75 ohms, also has calibration chart for direct power readings to 2 kw.

* Connectors.

* Cable.

* Rotators.

* Morse Keys.

* Switches.

* Code Practice Oscillators.

* Katsumi MC22 Microphone Compressor, completely self contained with battery and level meter.

* Katsumi EK26 Electronic Keyer, offers every feature you could want, relay and transistor switching as well as built in monitor oscillator.

* Yaesu YD-844 Desk microphone. This elegantly designed microphone not only performs excellently on many transceivers but also compares favourably with broadcast microphones. (See AR June '73, page 8)

* Low-pass filters.

* Alternator and Generator filters.

* Multi-band antenna traps.

* Digital Clocks, both AC and battery operated.

* Coaxial lighting arrestors.

* and the COMPLETE RANGE of Hy-Gain aerials, HF UHF and VHF.

The items on this page are but a few from our large and still growing range of accessories. If the accessory you require is not shown on this page then call us or our agents, we're sure to have it.
